11/08/2022

Overview

1. Renormalization strategy
2. Warm-up: flavor-singlet vector current
3. QCD energy-momentum tensor
4. Conclusions & outlook

Renormalization strategy

- Bare lattice operator $O \Rightarrow$ Renormalized operator O^R

$$O^R = Z_O \left[O + \sum_k \frac{c_k}{a^{d-d_k}} O_k \right] , \quad d = \dim(O)$$

- In our case Z_O , c_k fixed by imposing continuum Ward Identities on O^R
- ★ Thermal QCD with shifted and twisted boundary conditions

$$U_\mu(x_0 + L_0, \mathbf{x}) = U_\mu(x_0, \mathbf{x} - L_0 \boldsymbol{\xi})$$

$$\psi(x_0 + L_0, \mathbf{x}) = -e^{i\theta_0} \psi(x_0, \mathbf{x} - L_0 \boldsymbol{\xi})$$

$$\bar{\psi}(x_0 + L_0, \mathbf{x}) = -e^{-i\theta_0} \bar{\psi}(x_0, \mathbf{x} - L_0 \boldsymbol{\xi})$$

Flavor-singlet vector current

- Lattice local current

$$V_\mu^l(x) = \bar{\psi}(x)\gamma_\mu\psi(x)$$

- Lattice conserved current (Wilson fermions)

$$V_\mu^c(x) = \frac{1}{2} \left[\bar{\psi}(x + a\hat{\mu}) U_\mu^\dagger(x) (\gamma_\mu + 1) \psi(x) + \bar{\psi}(x) U_\mu(x) (\gamma_\mu - 1) \psi(x + a\hat{\mu}) \right]$$

- Definition of the renormalization constant ($L/a \rightarrow \infty$)

$$Z_V(g_0^2) = \lim_{a/L_0 \rightarrow 0} \left. \frac{\langle V_\mu^c \rangle_{\xi, \theta_0}}{\langle V_\mu^l \rangle_{\xi, \theta_0}} \right|_{g_0^2, L_0/a}$$

- Shift and twist $\xi = (1, 0, 0)$, $\theta_0 = \pi/6$

Flavor-singlet vector current

- $\mathcal{O}(a)$ -improvement

[Bhattacharya, Gupta, Lee, Sharpe, Wu, Phys. Rev. D **73** (2006), 034504]

$$\hat{V}_\mu^{c,l}(x) = V_\mu^{c,l}(x) - \frac{a}{4} c_V^{c,l} (\partial_\nu + \partial_\nu^*) (\bar{\psi}(x) [\gamma_\mu, \gamma_\nu] \psi(x))$$
$$\Rightarrow \langle V_\mu^{c,l} \rangle \quad \text{automatically improved}$$

- 1-loop improvement

[Skouroupathis, Panagopoulos, Phys. Rev. D **79** (2009), 094508]

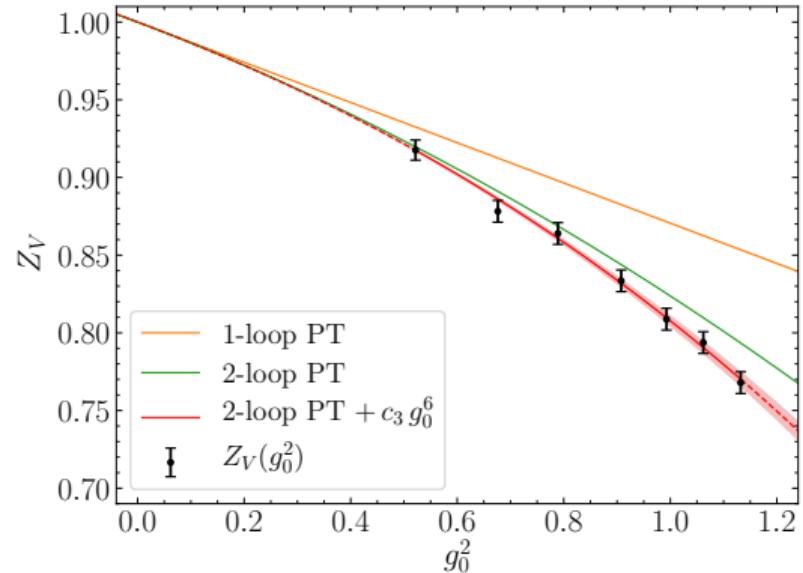

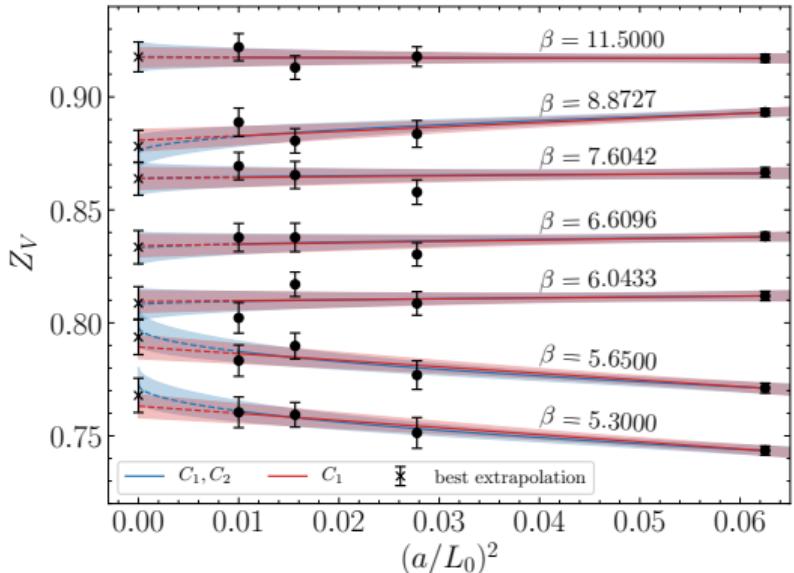

$$Z_V(g_0^2) = \lim_{a/L_0 \rightarrow 0} \left\{ \frac{\langle V_\mu^c \rangle_{\xi, \theta_0}}{\langle V_\mu^l \rangle_{\xi, \theta_0}} \Big|_{g_0^2, L_0/a} - \left[1 + c_1 g_0^2 - Z_V^{(0)} \left(\frac{a}{L_0} \right) - g_0^2 Z_V^{(1)} \left(\frac{a}{L_0} \right) \right] \right\}$$

- Expected scaling for $a/L_0 \rightarrow 0$

$$Z_V \left(g_0^2, \frac{a}{L_0} \right) = Z_V(g_0^2) + C_1 \cdot \left(\frac{a}{L_0} \right)^2 + C_2 \cdot (a \Lambda_{QCD}) \left(\frac{a}{L_0} \right) + C_3 \cdot (a \Lambda_{QCD})^2 + \dots$$

Flavor-singlet vector current

Wilson gauge action with $N_f = 3$ $\mathcal{O}(a)$ -improved Wilson fermions

$$Z_V^{\text{fit}}(g_0^2) = 1 - 0.129g_0^2 - 0.047g_0^4 - 0.016(3)g_0^6$$

[Bresciani, Dalla Brida, Giusti, Pepe, Rapuano, arXiv:2203.14754]

Energy-momentum tensor

- Lattice regularization

$$\begin{aligned} T_{\mu\nu}^{\text{lat}} &= T_{\mu\nu}^{\{1\}} + T_{\mu\nu}^{\{3\}} + T_{\mu\nu}^{\{6\}} \\ &= T_{\mu\nu}^{G,\{1\}} + T_{\mu\nu}^{F,\{1\}} + T_{\mu\nu}^{G,\{3\}} + T_{\mu\nu}^{F,\{3\}} + T_{\mu\nu}^{G,\{6\}} + T_{\mu\nu}^{F,\{6\}} \end{aligned}$$

- $T_{\mu\nu}^{\{3\}}, T_{\mu\nu}^{\{6\}}$ relevant for our approach to QCD thermodynamics
- No other operator mixing in renormalization:

$$T_{\mu\nu}^{R,\{3\}} = Z_G^{\{3\}} T_{\mu\nu}^{G,\{3\}} + Z_F^{\{3\}} T_{\mu\nu}^{F,\{3\}}$$

$$T_{\mu\nu}^{R,\{6\}} = Z_G^{\{6\}} T_{\mu\nu}^{G,\{6\}} + Z_F^{\{6\}} T_{\mu\nu}^{F,\{6\}}$$

- 4 conditions needed to determine the Zs

Energy-momentum tensor

- Continuum Ward Identity imposed on the sextet component at two chemical potentials

$$\left\{ \begin{array}{l} Z_G^{\{6\}} \langle T_{0k}^{G,\{6\}} \rangle_{\xi,\theta^A} + Z_F^{\{6\}} \langle T_{0k}^{F,\{6\}} \rangle_{\xi,\theta^A} = -\frac{\Delta f(L_0, \xi, \theta^A)}{\Delta \xi_k} + \mathcal{O}(a^2) \\ \\ Z_G^{\{6\}} \langle T_{0k}^{G,\{6\}} \rangle_{\xi,\theta^B} + Z_F^{\{6\}} \langle T_{0k}^{F,\{6\}} \rangle_{\xi,\theta^B} = -\frac{\Delta f(L_0, \xi, \theta^B)}{\Delta \xi_k} + \mathcal{O}(a^2) \end{array} \right.$$

- The same for the triplet

$$\langle T_{0k}^{R,\{6\}} \rangle_{\xi,\theta} = \xi_k \langle T_{0j}^{R,\{3\}} \rangle_{\xi,\theta} \quad (j \neq k, \xi_j = 0)$$

[Dalla Brida, Giusti, Pepe, JHEP 04 (2020) 043]

Energy-momentum tensor

- $N_f = 3$, $L/a = 288$, $\xi = (1, 0, 0)$

- $\theta_0 = 0$

β	L_0/a	N_{traj}	$\langle T_{\mu\nu}^{G,\{6\}} \rangle/T^4$	$\langle T_{\mu\nu}^{F,\{6\}} \rangle/T^4$	$\langle T_{\mu\nu}^{G,\{3\}} \rangle/T^4$	$\langle T_{\mu\nu}^{F,\{3\}} \rangle/T^4$

Conclusions & outlook

- Thermal QCD as a non-perturbative renormalization framework
 - Lower discretization errors with $\xi = (1, 0, 0)$
 - Non-trivial Ward Identities at $\xi \neq 0$
-
- ★ Non-perturbative renormalization of $T_{\mu\nu}$
 - ★ Properties of Quark-Gluon Plasma
 - ★ Non-perturbative determination of the QCD equation of state from 1 GeV to 100 GeV with target precision of 1%

$$\frac{s}{T^3} = -L_0^4 \frac{(1 + \xi^2)^3}{\xi_k} \langle T_{0k}^R \rangle, \quad T = \frac{1}{L_0 \sqrt{1 + \xi^2}}$$
