## On improvement and renormalisation of quark currents with stabilised Wilson fermions

*Tuesday, August 9, 2022 8:00 PM (1 hour)*

We report on the non-perturbative determination of the improvement coefficient  $c_A$  of the axial vector current  $A^\mu(x)$  in three-flavour lattice QCD with stabilised Wilson-Clover fermions.

Our computational method exploits the PCAC relation for two different pseudo-scalar states within the Schrödinger functional, which are modelled by altering the spatial structures at the boundaries via properly chosen wavefunctions.

The lattice spacings considered span a range that matches the gauge field ensembles with the stabilised Wilson-Clover action being generated by the OPEN LAttice initiative.

In the same framework and using chiral Ward identities, we also present preliminary results on the renormalisation constants  $Z_V$  and  $Z_A$  of the vector and axial vector current, respectively.
