

# **Finite temperature twisted mass Wilson fermion ensembles**

**A. Yu. Kotov**

**in collaboration with M.P. Lombardo, A. Trunin**

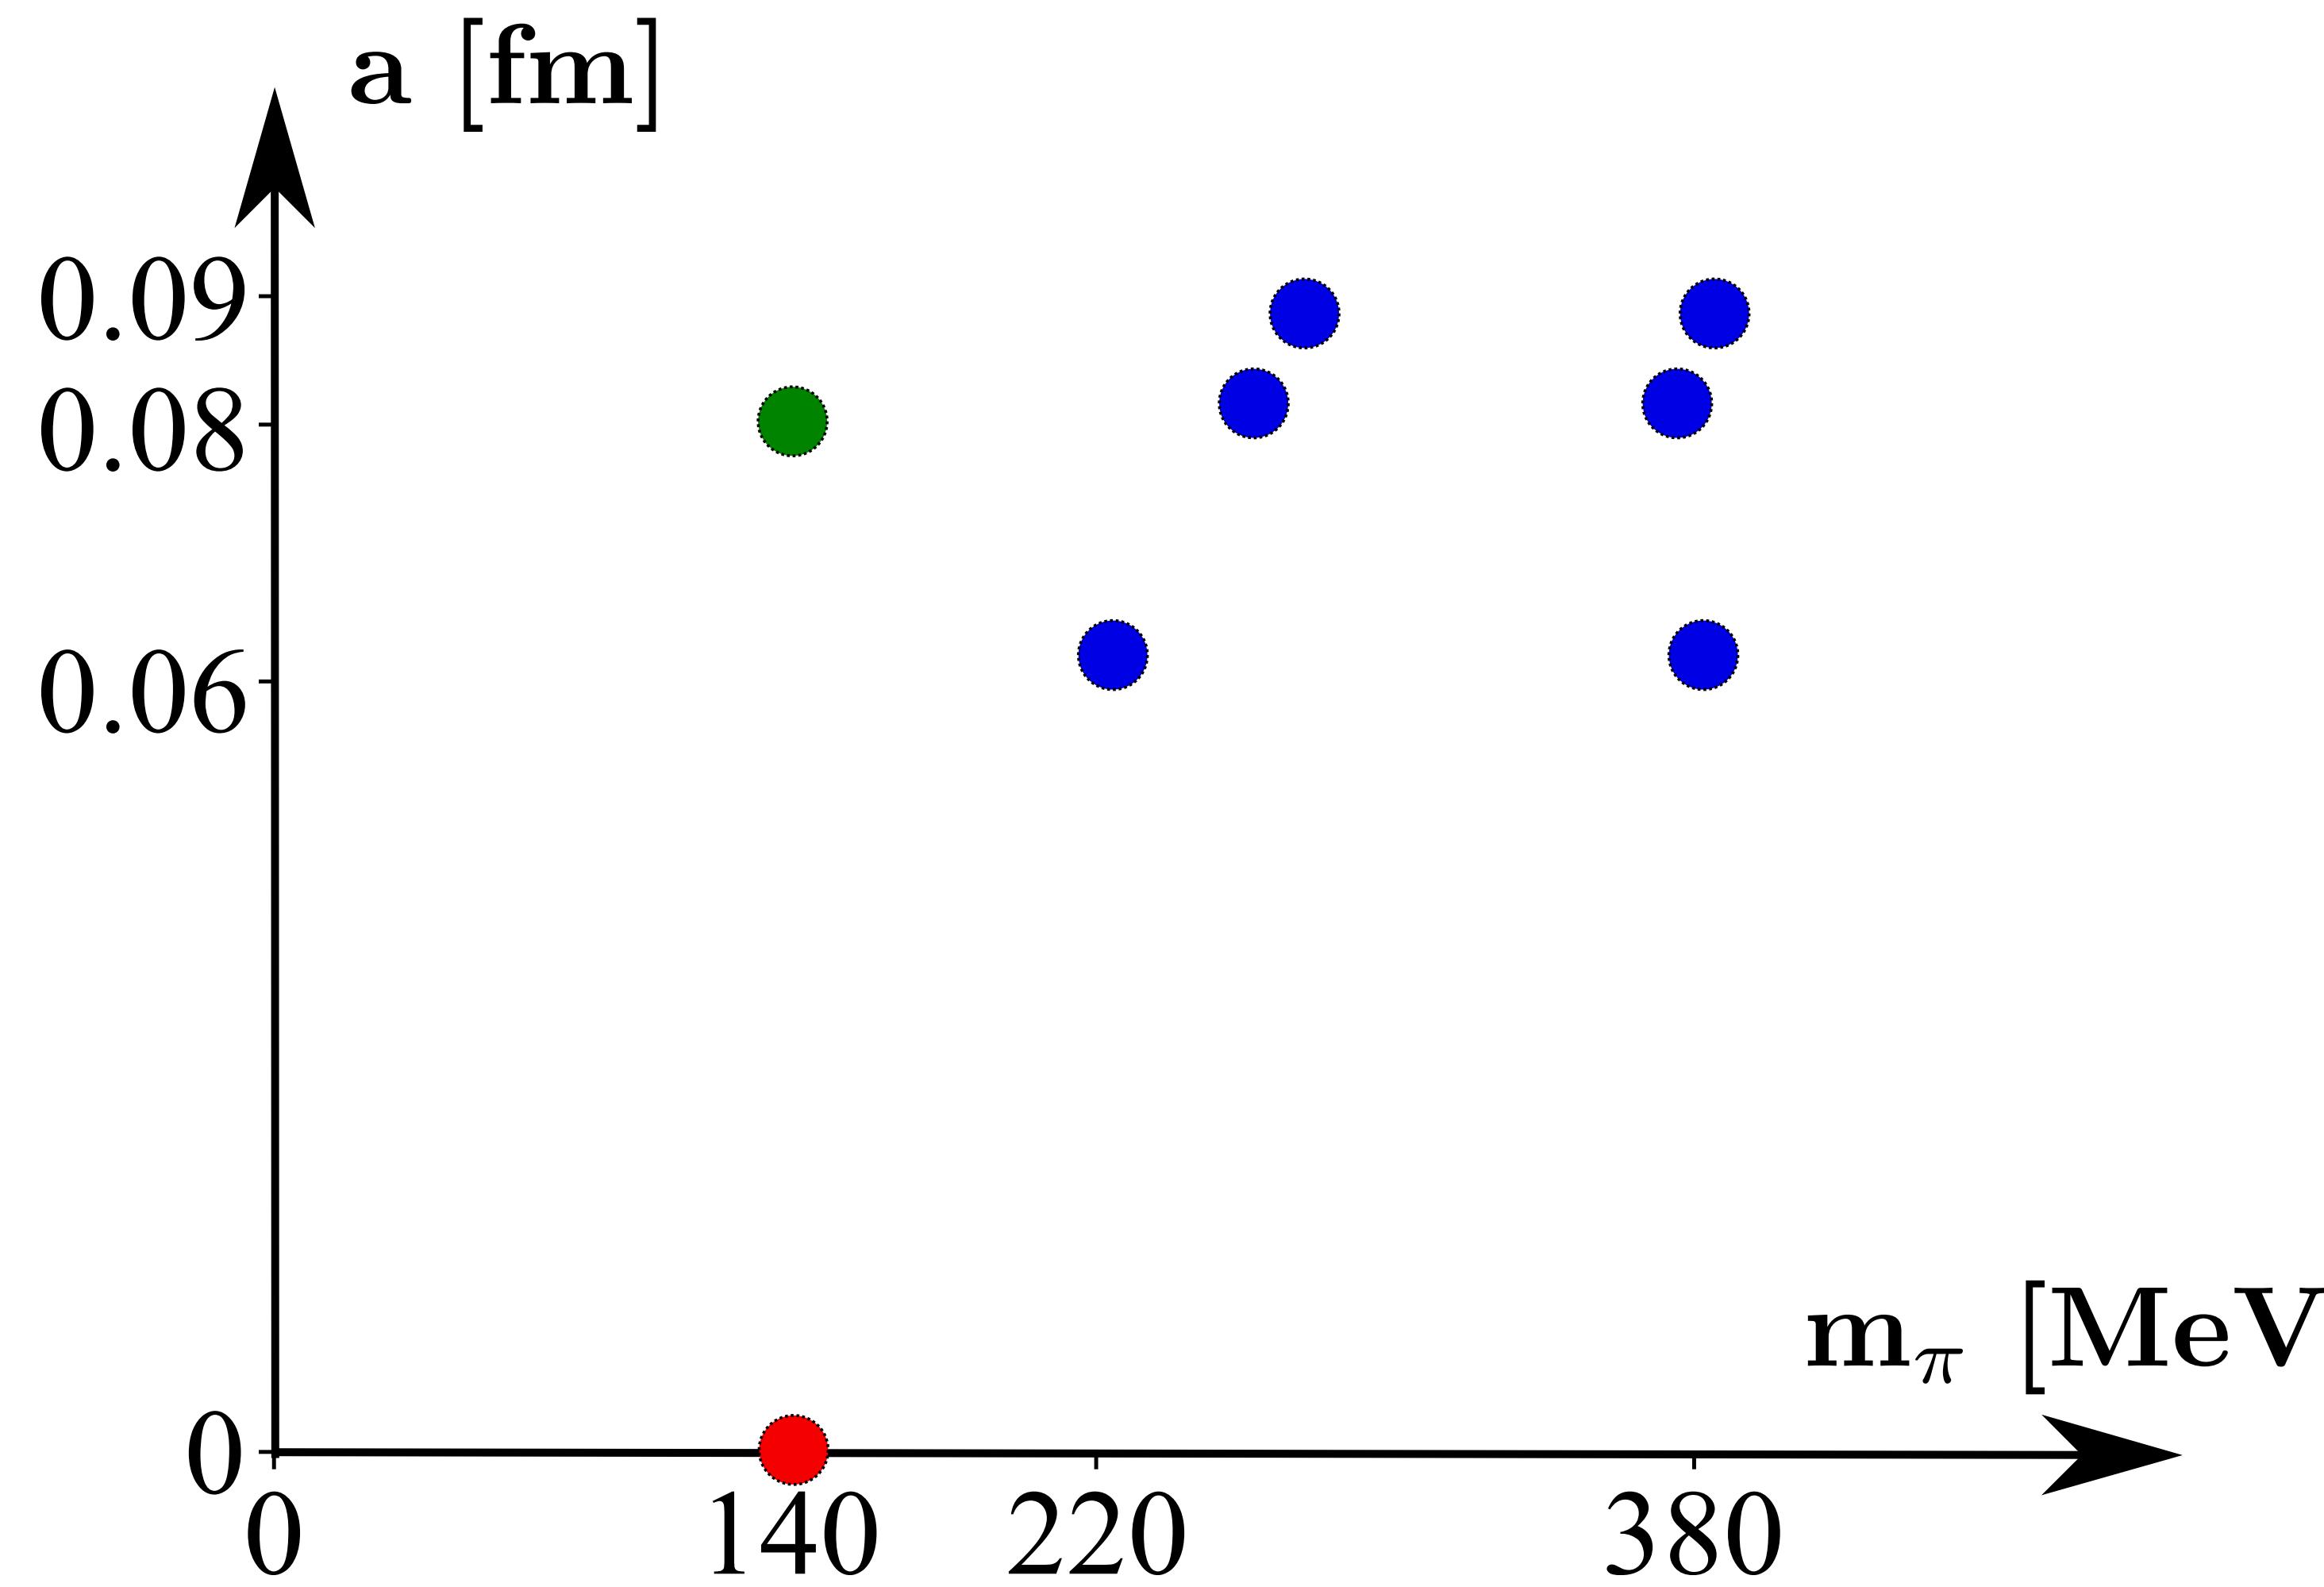

**Lattice 2022**

# Details of the simulations

- $N_f = 2 + 1 + 1$  **twisted mass** Wilson fermion (with and without clover term)
- Iwasaki gauge action
- Standard HMC algorithm, multigrid algorithm for Dirac inversions  
[Alexandrou et al., 2016]
- Finite temperature  $T \in (\sim 120, 600 - 800)$  MeV
- «Fixed scale» approach:  $a = \text{const}$ ,  $T \Leftrightarrow N_t$
- Public ETMC code, run on CPUs  
[<https://github.com/etmc/tmLQCD>]

# Ensemble summary

- Blue: Wilson twisted mass,  
 $1k - 10k$  configs per T
- Green: Wilson-clover twisted mass,  
 $O(500)$  configs per T
- Red: physical point
- Each point:  $O(10 - 20)$  values of  $N_t$
- $T \in (\sim 120, 600 - 800)$  MeV
- Each point: one or two spatial volumes
- Configurations separated by several MD traj.

Detailed summary: [Burger et al., 2018]  
[AK, Lombardo, Trunin, 2021]

# Collected metadata

## In the header of the file

- **Parameters** of the runs (lattice size, beta, bare quark mass etc.)
- **Plaquette**
- Date and time of generation, MD trajectory number
- Code version
- Precision (double)
- **Checksum**: was very useful to detect disk failures

# Data management

- Total space: 26 TB
- Stored at CINECA
- Two (or three) different copies (SCRATCH/DRES, another machine)

# Data management

- Total space: 26 TB
- Stored at CINECA
- Two (or three) different copies (SCRATCH/DRES, another machine)

# Data availability

- Not available to everyone: ongoing analysis
- Available at request/open for collaborations
- Future plans: after analysis we plan to make public

# Future plans

- Finer lattice spacings for  $m_\pi = 140$
- After analysis:  
plan to make public

Finite temperature  
twisted mass Wilson fermion ensembles  
«fixed scale» approach,  $O(10 - 20)$  values of  $N_t$   
 $T \in (\sim 120, 600 - 800)$  MeV
