Staggered fermion

$$S_{\mathrm{st}}(m) = \sum_{x,y} \bar{\psi}_{\mathrm{st}}(x) D_{\mathrm{st}}(x, y, m) \psi_{\mathrm{st}}(y)$$

Fermion doubling ❌
Chrial symmetry ✅

Clover fermion

$$S_{\mathrm{cl}}(m) = S_{\mathrm{w}}(m) + c_{\mathrm{sw}} \sum_{x} \bar{\psi}(x) \sigma_{\mu\nu} F^{\mu\nu} \psi(x)$$

Fermion doubling ✅
Chrial symmetry ❌

Overlap fermion

$$S_{\mathrm{c}}(m) = \sum_{x} \bar{\psi}(x) [(1 - \frac{m}{2\rho}) D_{\mathrm{ov}}(x, y, m) + \delta_{x,y} m] \psi(y)$$

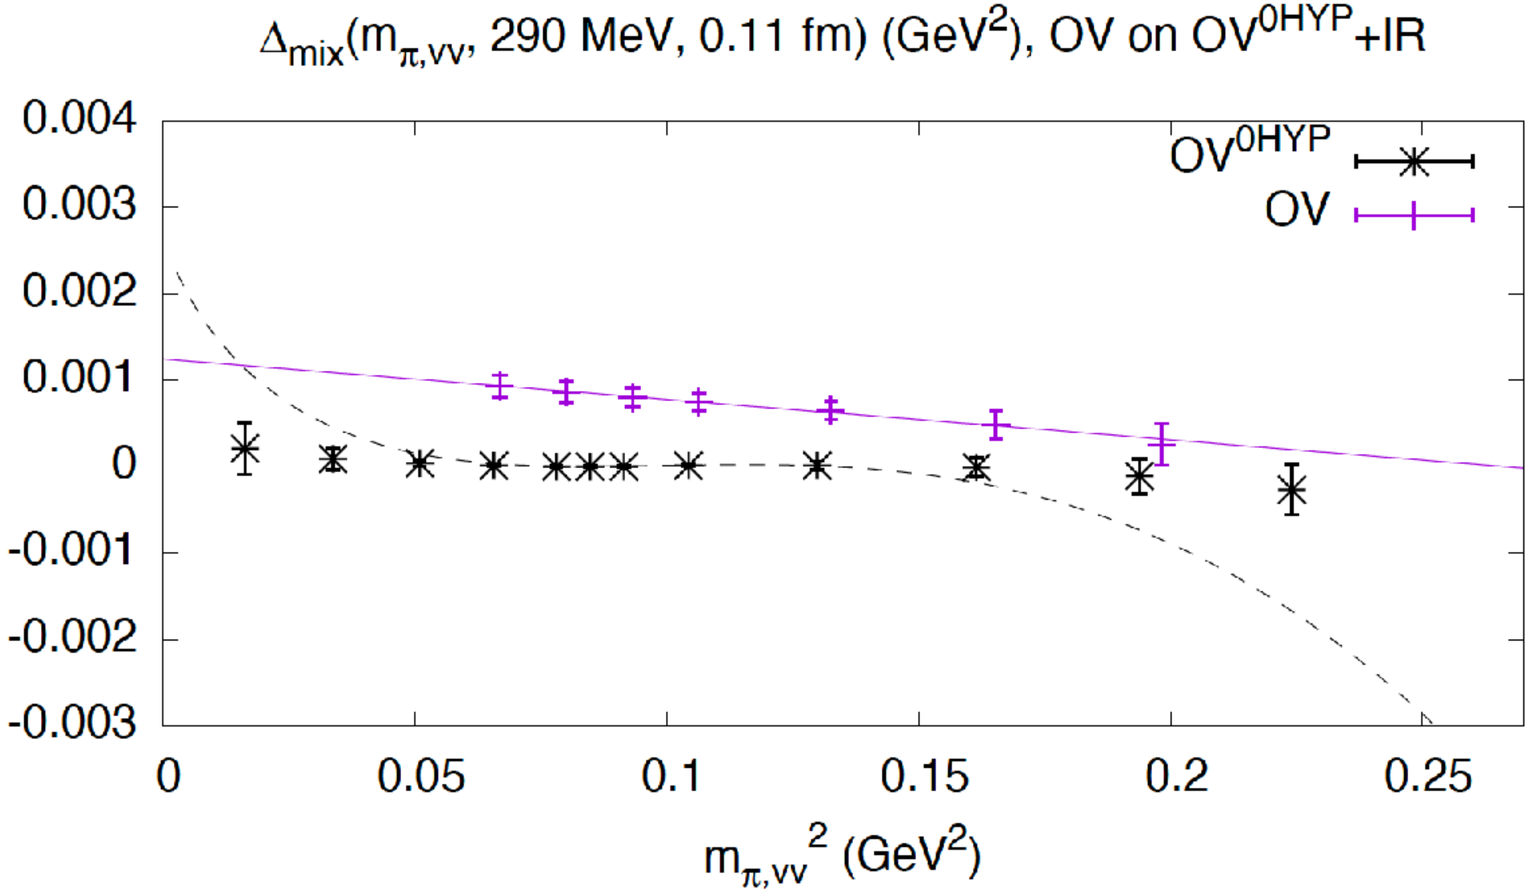
Innovation

1. based on the calculation at different lattice spacing
2. pion mass $m_{\pi,ss}$ is not limited to the case of ~300MeV
3. mixed action effect with kinds of the valence and sea fermion combinations

2. Methodology and setup

Contribution of the delta mix definition to the NLO at $m_{\pi,\mathrm{vv}} \neq m_{\pi,\mathrm{ss}}$



$$\Delta_{\mathrm{mix}}(m_{\pi,\mathrm{vv}}, m_{\pi,\mathrm{ss}}, a) \equiv m^2_{\pi,\mathrm{vs}} - \frac{m^2_{\pi,\mathrm{vv}} + m^2_{\pi,\mathrm{ss}}}{2}$$

$$\downarrow m_{\pi,\mathrm{vv}} = m_{\pi,\mathrm{ss}}$$

$$\Delta_{\mathrm{mix,uni}}(m_\pi, a) \equiv \Delta_{\mathrm{mix}}(m_\pi, m_\pi, a)$$

2. Methodology and setup

Valence fermion actions

HI: HISQ action without any additional smearing on the gauge link;

CL: Clover fermion with 1-step HYP smearing and tree level tadpole improved clover coefficient c_{sw};

OV: Overlap fermion with 1-step HYP smearing and $\rho = 1.5$.

4. Summary and outlook

1. Leading mixed action effect would be a^4, and are small when the sea fermion action has the chiral symmetry;
2. Ginsburg-Wilson relation fermion+Iwasaki gauge – smallest Δ_{mix} , $HI + S^{(1)}$– much larger Δ_{mix}, $CL_{stout} + S_{tad}$ – largest Δ_{mix} ;
3. Mechanism of a^4 scaling of Δ_{mix} and whether the Δ_{mix} can display a^2 scaling in other observables need further studies.
